

Croft's water absorption filter comprises of multi-functional water absorption fibres. It is capable to absorb and remove free water contents mixed into various lubricant oils (not all) by its super absorption features.

It has a double layer structure, with an outer layer of super absorbent material processed by a special method to a inner layer of acrylic fibre substance.

When it comes into contact with water it rapidly absorbs the water and swells to about 12 times its diameter - see photographs on the right.
