

*Croft Filters are one of very few Dixon Ring suppliers. Invented by Olaf George Dixon in 1946, Dixon Rings are made of stainless steel mesh material.*

*They come in various sizes: some as small as 1/16".*

*Historically, the sheer cost of manufacturing these tiny components in any great quantity was a major obstacle. Today, this is no longer the case.*

*At Croft Filters, we have developed a machine that automates the entire process of making Dixon Rings at high speed. As a result, we can produce Dixon Rings in very high volumes - something we could never have achieved without our employees' outstanding design skills and manufacturing excellence.*
