

Product Guide

# Screen Filters

**Screen filters or flat plate filters are generally used as an inline process, filtering relatively low-viscosity fluids.**

Each product supplied is custom manufactured to your system considering: pressure, flow rate and filtration level required.

These filters provide a large filtering surface whilst minimising the pressure drop within the system. The flat plate can also be curved or rolled to fit the specific application. Depending on the design requirements and application, each filter can be manufactured in perforated plate, wire mesh and wedge wire.
